                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            67
                                                                                                                                                                         Novel xylanase(s) having activity at 80 deg.C. or higher - obtained from anaerobic thermophilic bacteria and used in paper and pulp production
                                                                                                                                                                                                                                                                                                                        A full-length xynD gene (AAT08142) codes for a thermostable G-type xylanase (AAR87012) useful in the pulp and paper industries. The gene wobtd. by genomic walking PCR of DNA from an extremely thermophilic bacterium, strain TG456 (BS 213.94), isolated from a New Zealand hot spring. The gene can be inserted into a vector and used for the produce recombinant xylanase D in microbial host cells, esp. Escherichia coli. (Updated on 25-MAR-2003 to correct DI field.) (Updated on 27-MUG-2003 to correct DI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes an isolated or recombinant polypeptide (I), having 50% or more identity to 190 300-1200 residue amino acid sequences (S1), given in the specification, over a region of 100 or more residues and the polypeptide as thermostable xylanase activity. (I) is useful for: dough conditioning; beverage production, as a nutritional supplement in animal feed; reducing lignin in a wood or a wood product; and for eliminating and protecting animals from a microorganism comprising xylan. The polynucleotide (II) encoding (I) is useful for amplifying nucleic acid encoding a polypeptide having a xylanase activity which involves amplification of a template nucleic acid with a primer pair capable of amplifying (II) or its subsequence. (I) is useful for treating and preventing bacterial infection and fungal infection e.g. coccidiosis. This sequence encodes xylanase protein isolated from an environmental

Sequences were basecalled with phred and vector was masked with
crossmatch (see http://genome.washington.edu). Sequences were then
trimmed from both ends to remove low quality bases and masked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Trypanosoma cruzi

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces survarum, Saccharomyces Saccharomyces harvenii, Aluyveromyces Marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sonbirophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA linear GSS 18-JUL-2001 RPCI-24-356N3.TJ RPCI-24-356N3, genomic clone RPCI-24-356N3, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               636

Library constructed by Dr. Yutaka Suzuki and Dr. Sumio Sugano in
the Human Genome Center, University of Tokyo Institute of Medical
Science, plant material and RNA prepared at Texas A & M University;
sequencing done in the Laboratory for Genomics and Bioinformatics,
'University of Georgia. Sequence ends have been trimmed to exclude
vector and regions below Phred quality 16. Three-prime sequences
are presented as their reverse complement and have been trimmed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CN132941 728 bp mRNA linear EST 01-APR-2004 OX1_9_D10.bl_A002 Oxidatively-stressed leaves and roots Sorghum bicolor cDNA clone OX1_9_D10_A002 3', mRNA sequence.

/clone=loY3 = Laxon: The phage-resistant E. coli"
/clone=loY3 = Laxon: The library was prepared from poly4+
RNA from oxidatively stressed, hydroponically grown
sorghum seedlings. At 8 days of age, growth medium was
supplemented with hydrogen peroxide to 0.003* and leaves
were misted with 10 um methyl viologen. Leaves and roots
were harvested at 3, 12 and 27 hr after treatment and all
tissue pooled. Double-stranded cDNA was cloned
unidirectionally into different Draili sites of the
phases-Fi3 vector. (5-prime Draili site is CACCATGTG). XhoI excises the cDNA

Library constructed by Dr. Yutaka Suzuki and Dr. Sumio Sugano in
the Human Genome Center, University of Tokyo Institute of Medical
Science; plant material and RNA prepared at Texas A & M University;
sequencing done in the Laboratory for Genomics and Bioinformatics,
University of Georgia. Sequence ends have been trimmed to exclude
vector and regions below Pired quality 16. Three-prime sequences
are presented as their reverse complement and have been trimmed to
exclude polyA.

/dlone lib="Ethylene-tranged from polyth-RNA from seedlings grown in hydroponic culture. At 8 days of age, medium was supplemented with 0.5 mM 1-aminocyclopropane-1-carboxylic acid (ACC) to induce endogenous ethylene (FTH) production. Roots and shoots were harvested after 27 and 72 hr and material from both time points was combined prior to RNA isolation. Double-stranded cDNA was cloned unidirectionally into different Drall sites of the pwBl85-FL3 vector (5-prime Drall site is CACTGTGTG, 3-prime Drall site is CACTGTGTG). Xhol excises the CDNA
